

Land Transport

MOF Subic has a wide array of choices for transporting within a project site or from any designated pick-up point to any destination.

A careful study of the route, height limitations, bridge ratings, grades and road conditions are all collectively considered in deciding the best type of trailer / primemover combination.

Shown below is a 43T HRSG Side Panel being moved on an 8-line Goldhofer Trailer up an 8% grade.

Our transport equipments compliment each other. Most project sites in the Philippines are isolated. Careful planning is a must for the project cargo to reach the site safely and on time. This requires control over the land and sea routes.

MOFS Engineering provides the technical support to enable proper planning and execution in the transport of over size cargoes.
